What is AMS 2430 Shot Peening?

Definition and Purpose

AMS 2430 is an aerospace material specification that outlines the requirements for shot peening media. Though often associated with the process, it also encompasses standards for the shot peening operation itself, ensuring that components receive a uniform treatment that imparts beneficial compressive stresses on the surface. The primary goal of shot peening under AMS 2430 is to enhance fatigue resistance, reduce stress corrosion cracking, and improve the overall lifespan of aerospace components, such as aircraft wings, landing gear, and turbine blades.

Scope and Applicability

The AMS 2430 standard applies to all metallic components in the aerospace industry that require shot peening to improve mechanical properties. It covers:

- Types of peening media (e.g., steel, ceramic, glass)
- Media quality and size
- Process parameters like intensity and coverage
- Testing and inspection procedures

- Documentation and quality assurance

The standard ensures consistency across different manufacturers and service providers, facilitating safety and reliability in aerospace applications.

Media Specifications Under AMS 2430

Types of Shot Media

The choice of media is critical for achieving the desired peening effect. AMS 2430 specifies several types of shot media, each suitable for different applications:

- **Steel Shots:** Often used due to their durability and effectiveness, available in various hardness levels.
- **Ceramic Shots:** Harder than steel, providing a more uniform peening surface, ideal for sensitive components.
- **Glass Beads:** Used for a softer peening process, mainly for decorative or cleaning purposes.
- **Plastic Media:** Suitable for delicate components where minimal surface deformation is required.

Media Size and Quality

The specification emphasizes that media size directly influences the peening intensity and coverage. Typical specifications include:

- Diameter ranges (e.g., 0.1 mm to 2 mm)
- Surface cleanliness
- Absence of contamination or degradation

Manufacturers must ensure media is free from impurities and damages that could compromise the process or the component.

Media Hardness and Composition

To prevent excessive surface deformation or damage, AMS 2430 mandates specific hardness levels for different media types. For example:

- Steel shots: Hardness typically ranges from 58 to 62 HRC
- Ceramic shots: Usually above 70 HRC

- Media must also meet purity standards to avoid introducing contaminants.

Shot Peening Process Parameters

Intensity and Coverage

Two core parameters govern the effectiveness of shot peening:

- **Intensity:** The measure of the peening energy, often expressed in terms of Almen intensity (A-scale). AMS 2430 specifies acceptable intensity ranges depending on the application.
- **Coverage:** The percentage of the surface area impacted by shots. Full coverage (100%) ensures uniform residual compressive stresses.

Maintaining proper intensity and coverage is vital to prevent under- or over-peening, which can lead to inadequate fatigue resistance or surface damage.

Process Control and Equipment

- **Blast Equipment:** Must be calibrated regularly to maintain consistent shot velocity and distribution.
- **Nozzle Configuration:** Proper nozzle size and angle help achieve uniform coverage.
- **Part Positioning:** Components should be held in a manner that allows uniform shot impact without shadowing or uneven treatment.

Temperature and Environment

Shot peening is typically performed at ambient temperatures, but certain materials or processes may require temperature controls to prevent heat-induced distortions or residual stresses from other sources.

Testing and Inspection According to AMS 2430

Almen Intensity Testing

The Almen test is a standard method to quantify peening intensity. It involves:

- Using Almen strips (small steel plates)
- Measuring deflection after peening

- Ensuring the intensity falls within the specified range

Regular Almen testing guarantees process consistency across different batches and operators.

Coverage Inspection

Coverage is assessed visually or through specialized dyes that highlight impacted areas. Achieving 100% coverage is critical for reliable residual stress induction.

Residual Stress Measurement

Advanced non-destructive methods, such as X-ray diffraction, are used to measure residual stresses post-peening. These measurements confirm that the process has achieved the desired compressive stress levels.

Process Documentation and Quality Assurance

- Maintaining detailed records of media batch numbers, process parameters, and inspection results.
- Conducting periodic audits to ensure compliance with AMS 2430 standards.

Benefits of Shot Peening per AMS 2430

Enhanced Fatigue Life

One of the primary advantages of shot peening under AMS 2430 is the significant improvement in fatigue resistance. By inducing a layer of residual compressive stress, components can withstand cyclic loading better than untreated parts.

Corrosion Resistance

Shot peening can also reduce the susceptibility of metals to stress corrosion cracking, especially in aggressive environments like aerospace settings.

Surface Toughness and Wear Resistance

The process can improve surface hardness and toughness, leading to higher resistance to wear and erosion.

Controlled Surface Finish

Depending on the process parameters, shot peening can also produce a desirable surface finish, which is beneficial for certain applications.

Applications of AMS 2430 Shot Peening

- **Aerospace Components:** Wings, turbine blades, landing gear, and fuselage structures
- **Automotive Industry:** Crankshafts, connecting rods, and valve springs
- **Power Generation:** Turbines and nuclear plant components
