Before examining Kothandaraman's contributions, it is crucial to understand the foundational

concepts of heat and mass transfer.

What is Heat Transfer?

Heat transfer refers to the movement of thermal energy from one system or part of a system to another due to a temperature difference. It occurs via three primary mechanisms:

- Conduction: Transfer of heat through a solid medium without any movement of the material itself. The heat flows from a region of higher temperature to a lower temperature through molecular interactions.
- Convection: Transfer of heat through fluid motion, involving bulk movement of liquids or gases. It can be natural (due to buoyancy) or forced (using fans or pumps).
- Radiation: Transfer of heat through electromagnetic waves, capable of occurring in a vacuum, such as the heat from the sun reaching Earth.

What is Mass Transfer?

Mass transfer involves the movement of mass from one location to another, driven by concentration gradients. It is fundamental in processes like distillation, absorption, drying, and chemical reactions. The mechanisms include:

- Diffusion: Movement of molecules from high to low concentration regions, described mathematically by Fick's laws.
- Advection: Transport by bulk fluid flow, often coupled with diffusion in complex systems.

Heat Transfer Mechanisms in Minichannels and Microchannels

Convective Heat Transfer

Convective heat transfer dominates in these small channels, governed by the Nusselt number (Nu), which relates convective to conductive heat transfer:

$$Nu = \frac{hD_h}{k}$$

Where:

- h = convective heat transfer coefficient.
- D_h = hydraulic diameter.
- k = thermal conductivity of the fluid.

In microchannels, the high surface-area-to-volume ratio enhances heat transfer, often leading to higher Nusselt numbers compared to larger channels.

Conduction and Conjugate Heat Transfer

Due to small dimensions, conduction within the channel walls and conjugate heat transfer effects become significant, especially when the wall material has low thermal conductivity or when the heat flux is high.

Scaling Laws and Correlations

Classical correlations developed for larger channels often need modifications or new formulations when applied to microchannels. For laminar flow, the Nusselt number can often be approximated as constant (e.g., $Nu \approx 3.66$ for fully developed laminar flow with constant wall temperature). For turbulent flow, correlations are more complex and depend on the roughness, flow regime, and fluid properties.

Features:

- Enhanced heat transfer due to high surface-area-to-volume ratio.
- Possible deviation from classical correlations at micro scales.

Challenges:

- Lack of universally accepted correlations for all flow regimes.
- Need for experimental validation in specific applications.
