Understanding Solubility: The Fundamentals

What Is Solubility?

Solubility refers to the maximum amount of a substance (solute) that can dissolve in a given amount of solvent at a specific temperature, resulting in a saturated solution. It is typically expressed in units such as grams per 100 milliliters (g/100 mL), molarity (mol/L), or molality (mol/kg).

Factors Affecting Solubility

- **Temperature:** Usually, increasing temperature increases solubility for most solids and liquids, but exceptions exist, especially with gases.
- **Nature of the solute and solvent:** "Like dissolves like" ? polar solutes tend to dissolve in polar solvents, nonpolar in nonpolar.
- **Pressure:** Significant for gases; increasing pressure increases gas solubility.
- **Presence of other substances:** Common ion effect and complex formation can influence solubility.

Types of Solubility

- **Soluble:** Substances that dissolve readily in a solvent (e.g., NaCl in water).
- **Insoluble:** Substances that do not dissolve appreciably.
- **Slightly soluble:** Substances with limited solubility, forming saturated solutions.

Common Solubility Rules and Guidelines

Solubility Rules for Ionic Compounds

These rules help predict whether an ionic compound will dissolve in water:

- Most salts containing alkali metal ions (Li^+ , Na^+ , K^+ , Cs^+ , Rb^+) are soluble.
- Nitrates (NO_3^-), acetates (CH_3COO^-), and chlorates (ClO_3^-) are generally soluble.
- Chlorides, bromides, and iodides are soluble except those containing Ag^+ , Pb^{2+} , and Hg_2^{2+} .
- Sulfates are soluble except BaSO_4 , PbSO_4 , and CaSO_4 .
- Most carbonates, phosphates, silicates, and sulfides are insoluble, except those containing alkali metals or ammonium.

Answer: Yes, NaCl is highly soluble in water because it is an ionic compound containing alkali metal ions, which are generally soluble according to the solubility rules.

Question 2: Which of the following compounds is insoluble in water? a) AgCl , b) KNO_3 , c) Na_2SO_4

Answer: a) AgCl . Silver chloride is insoluble in water, whereas potassium nitrate and sodium sulfate are soluble.

Question 3: How does increasing temperature affect the solubility of solids in liquids?

Answer: Generally, increasing temperature increases the solubility of solids in liquids because higher temperatures provide more energy to break intermolecular forces, allowing more solute to dissolve.
