Common Questions in the Cell Energy Cycle Gizmo and Their

Answers

Below are some typical questions you might encounter in the gizmo, along with detailed explanations from the answer key.

1. What is the primary purpose of cellular respiration?

Answer:

The primary purpose of cellular respiration is to convert the chemical energy stored in glucose into ATP, the energy molecule used by cells to perform work. This process involves breaking down glucose molecules in the presence of oxygen to produce carbon dioxide, water, and energy.

2. Which stages of cellular respiration produce the most ATP?

Answer:

The electron transport chain produces the most ATP during cellular respiration. It harnesses energy from electrons transferred through protein complexes to generate a large amount of ATP via oxidative phosphorylation.

3. How does changing oxygen levels affect ATP production?

Answer:

Lower oxygen levels decrease the efficiency of the electron transport chain, leading to less ATP production. In hypoxic conditions, cells may rely more on glycolysis, which produces less ATP per glucose molecule.

4. What role do mitochondria play in the cell energy cycle?

Answer:

Mitochondria are the site of most stages of cellular respiration, including the Krebs cycle and electron transport chain. They facilitate the production of ATP by providing the necessary enzymes and environment for these processes.
