Sample Objective Questions with Detailed Solutions

Below are several sample questions spanning different topics with step-by-step solutions to enhance understanding.

Question 1: Basic Concept

Q: Which of the following laws states that the algebraic sum of currents entering a junction equals zero?

- a) Ohm's Law
- b) Kirchhoff's Current Law (KCL)
- c) Kirchhoff's Voltage Law (KVL)
- d) Thevenin's Theorem

Solution:

The correct answer is b) Kirchhoff's Current Law (KCL).

Explanation:

Kirchhoff's Current Law (KCL) states that the total current entering a junction equals the total current leaving the junction, which can be written as the algebraic sum of currents being zero (considering directions).

Question 2: Resistance Calculation

Q: Find the equivalent resistance between points A and B in the following resistor network:

- Resistors $R_1 = 4\Omega$ and $R_2 = 6\Omega$ are in series.
- This series combination is in parallel with $R_3 = 12\Omega$.

Solution:

Step 1: Calculate the series resistance R_{series} :

$$R_{\text{series}} = R_1 + R_2 = 4\Omega + 6\Omega = 10\Omega$$

Step 2: Find the parallel combination with R_3 :

$$R_{\text{eq}} = \left(\frac{1}{R_{\text{series}}} + \frac{1}{R_3} \right)^{-1} = \left(\frac{1}{10} + \frac{1}{12} \right)^{-1}$$

Calculate the sum:

$$\frac{1}{10} + \frac{1}{12} = \frac{6}{60} + \frac{5}{60} = \frac{11}{60}$$

So,

$$R_{\text{eq}} = \frac{60}{11} \approx 5.45\Omega$$

Answer: Approximately 5.45Ω .

Question 3: Thevenin's Equivalent

Q: Find the Thevenin equivalent voltage and resistance seen at terminals A-B of the circuit where a 12V source is connected in series with a 4Ω resistor, and this combination is connected across the A-B terminals with a 6Ω resistor in parallel.

Solution:

- Step 1: Remove the load (if any) across A-B; find open-circuit voltage (V_{Th}).
- Step 2: Calculate the Thevenin resistance (R_{Th}).

Assuming the circuit is a voltage source (12V) in series with 4 Ω resistor, connected across A-B, with a 6 Ω resistor connected from A to B in parallel with the load.

V_{Th} :

Since the source is directly connected, the open-circuit voltage at A-B is simply 12V (assuming the resistor is in series with the source and no load connected).

R_{Th} :

Turn off the voltage source (replace with short circuit):

- The 4 Ω resistor and 6 Ω resistor are now in parallel.
- $R_{Th} = (4\Omega \parallel 6\Omega) = (4\Omega + 6\Omega) = 24 / 10 = 2.4\Omega$.

Answer:

- $V_{Th} = 12V$
- $R_{Th} = 2.4\Omega$

Question 4: AC Circuit Impedance

Q: Calculate the total impedance of a series R-L circuit with $R = 10\Omega$ and $L = 0.1H$ at a frequency of 50Hz.

Solution:

Impedance of inductor:

$$Z_L = j \omega L$$

where $\omega = 2\pi f = 2\pi \times 50 \approx 314.16 \text{ rad/sec}$

Calculate Z_L :

$$Z_L = j \times 314.16 \times 0.1 = j \times 31.416\Omega$$

Total impedance:

$$Z_{\text{total}} = R + Z_L = 10 + j 31.416 \Omega$$

Magnitude:

$$|Z_{\text{total}}| = \sqrt{R^2 + X_L^2} = \sqrt{10^2 + 31.416^2} \approx \sqrt{100 + 987.4} \approx \sqrt{1087.4} \approx 33.0 \Omega$$

Answer:

Total impedance magnitude $\approx 33 \Omega$ with phase angle:

$$\theta = \tan^{-1}\left(\frac{X_L}{R}\right) \approx \tan^{-1}\left(\frac{31.416}{10}\right) \approx 72.5^\circ$$
