Sample Questions from EAS 203 Engineering Mathematics 2 Solved Paper

Question 1: Solve the Differential Equation $\left(\frac{dy}{dx} + y \tan x = \sin^2 x \right)$

Solution:

Step 1: Recognize as a first-order linear ODE.

Step 2: Write in standard form:

$$\left[\frac{dy}{dx} + P(x) y = Q(x) \right]$$

where $\left(P(x) = \tan x \right)$, $\left(Q(x) = \sin^2 x \right)$.

Step 3: Find integrating factor:

$$\left[\mu(x) = e^{\int P(x) dx} = e^{\int \tan x dx} = e^{-\ln |\cos x|} = \frac{1}{\cos x} \right]$$

Step 4: Multiply entire equation by $\left(\mu(x) \right)$:

$$\left[\frac{1}{\cos x} \frac{dy}{dx} + \frac{\tan x}{\cos x} y = \frac{\sin^2 x}{\cos x} \right]$$

which simplifies to:

$$\left[\frac{dy}{dx} \right] \left(\frac{y}{\cos x} \right) = \frac{\sin^2 x}{\cos x}$$

Step 5: Integrate both sides:

$$\left[\frac{y}{\cos x} \right] = \int \frac{\sin^2 x}{\cos x} dx + C$$

Using $(\sin^2 x = 1 - \cos^2 x)$:

$$\left[\int \frac{1 - \cos^2 x}{\cos x} dx = \int \frac{1}{\cos x} dx - \int \cos x dx \right]$$

$$\left[= \int \sec x dx - \int \cos x dx \right]$$

$$\left[= \ln |\sec x + \tan x| - \sin x + C' \right]$$

Thus:

$$\left[y = \cos x \left(\ln |\sec x + \tan x| - \sin x + C' \right) \right]$$

This is the general solution.
