- Tolerances and Fits

Q6: Explain the difference between clearance fit, interference fit, and transition fit.

A6:

These are types of fits used to assemble parts:

- Clearance Fit: Always leaves a gap between the hole and shaft; allows easy assembly and movement. Example: sliding fit.
- Interference Fit: The shaft is larger than the hole, requiring force to assemble; used for permanent assemblies. Example: press fit.
- Transition Fit: Can result in either a clearance or interference fit, depending on tolerances; used where precise control is needed.

Understanding fits is essential for designing assemblies that perform correctly under operational loads.

- Principles of Measurement and Errors

A7:

To ensure accuracy:

- Use calibrated instruments regularly.
- Take multiple measurements and average results.
- Measure at the correct temperature (preferably room temperature) to prevent expansion or contraction.
- Ensure instruments are clean and free from debris.
- Properly align the measuring instrument with the workpiece.
- Handle instruments carefully to avoid damage.
- Use the correct measuring instrument suitable for the measurement range.

Reducing errors leads to better quality control and precise machining.

- Machining Calculations

Q8: Calculate the taper angle if a workpiece has a diameter of 50 mm at one end and 40 mm at the other over a length of 200 mm.

A8:

The taper angle (?) can be calculated using the formula:

$$\theta = \arctan \left(\frac{\text{Difference in diameter}}{2 \times \text{length}} \right)$$

Step-by-step:

- Difference in diameter = 50 mm - 40 mm = 10 mm.
- Radius difference = 10 mm / 2 = 5 mm.
- Length = 200 mm.

$$\theta = \arctan \left(\frac{5}{200} \right) = \arctan (0.025) \approx 1.43^\circ$$

\\

Answer: The taper angle is approximately 1.43 degrees.
