Preparing Your Model for Crushing Simulation

Before diving into simulations, proper preparation of your model is vital. This involves defining geometry, selecting appropriate material models, and setting up the analysis parameters.

1. Geometry Creation

Start by creating the 3D geometry of the component or assembly to be tested. Use Abaqus/CAE's part module to sketch and extrude or revolve shapes as needed. Ensure that the geometry accurately represents the physical part, especially in regions prone to crushing.

2. Material Selection and Properties

Choosing the right material model is crucial for realistic crushing behavior. Common options include:

To simulate crushing accurately, include damage initiation and evolution:

1. Damage Models and Criteria

Abaqus supports several damage models:

- Plastic damage models: Combine plasticity and damage evolution.
- Cohesive elements: Inserted at interfaces to model crack growth.
- Failure surfaces: Define failure criteria based on stress or strain thresholds.

2. Damage Evolution and Post-Failure Behavior

Set parameters for damage evolution:

- Damage initiation: When failure criteria are met.
- Damage evolution: How material stiffness degrades over time.
- Final failure: Complete separation or collapse.

Ensure your material model includes these parameters to simulate crushing realistically.

Running the Simulation and Post-Processing Results

After setting up, run the analysis:

- Check for convergence issues, especially in highly nonlinear crushing simulations.
- Use Abaqus/CAE's visualization tools to analyze results.

1. Analyzing Deformation and Failure Modes

Use contour plots to visualize:
