Introduction to Thermodynamics

Thermodynamics is the branch of physics that deals with the relationships between heat, work, temperature, and energy. It governs the behavior of physical systems and is fundamental to understanding how energy is transferred and transformed in natural and engineered systems.

Key Concepts in Thermodynamics

- System and Surroundings: The system refers to the part of the universe under study, while the surroundings encompass everything outside the system.
- State Functions: Properties such as temperature, pressure, volume, and internal energy that define the state of a system.
- Processes: Changes from one state to another, including isothermal, adiabatic, isobaric, and isochoric processes.

Understanding Temperature in Thermodynamics

Temperature is a measure of the average kinetic energy of particles within a substance. It plays a crucial role in determining the direction of heat transfer and the state of a system.

Definition and Units of Temperature

- Definition: Temperature quantifies the thermal energy of a system.
- Units:

- Celsius ($^{\circ}\text{C}$): Based on the freezing and boiling points of water.
- Kelvin (K): The SI base unit, starting at absolute zero.
- Fahrenheit ($^{\circ}\text{F}$): Used primarily in the United States.

Absolute Zero and the Kelvin Scale

- Absolute Zero: The theoretical temperature where particles have minimum thermal motion, at 0 K.
- Kelvin Scale: Starts at absolute zero, with units equal to Celsius degrees.

Measuring Temperature

- Thermometers: Devices such as mercury thermometers, thermocouples, and resistance temperature detectors.
- Thermal Equilibrium: When two systems in contact reach the same temperature, no net heat transfer occurs.

Heat in Thermodynamics

Heat is a form of energy transfer between systems due to a temperature difference. It is not a property of a system but a process quantity.

Definition of Heat

- Heat (Q): Energy transferred because of a temperature difference, measured in joules (J).

Methods of Heat Transfer

- Conduction: Transfer through direct contact.
- Convection: Transfer via fluid movement.
- Radiation: Transfer through electromagnetic waves.

Heat Capacity and Specific Heat

- Heat Capacity (C): The amount of heat needed to change a system's temperature by 1°C .
- Specific Heat (c): Heat capacity per unit mass, indicating how much energy is needed to raise 1

gram of a substance by 1°C.

Thermodynamics Laws Relevant to Temperature and Heat

First Law of Thermodynamics

- States that energy cannot be created or destroyed; it can only be transferred or changed in form.
